This application is a continuation-in-part of Application Serial Number 08/204,055, filed March 2, 1994, which is a continuation-in-part of Application Serial Number 08/052,835, filed April 27, 1993.

Field of the Invention

The present invention relates generally to  $\alpha$ -amino acids and  $\alpha$ -aminoboronic acids and corresponding peptide analogs in which the alpha substituted is substituted with an aromatic guanidino, amidino group, halogen, cyano group, aliphatic amidino, formamidino group, or other neutral group.

Background of the Invention

20

Simple boronic acids are inhibitors of serine proteases. For example, Koehler et al. *Biochemistry* 10: 2477 (1971) reports that 2-phenylethane boronic acid inhibits chymotrypsin at millimolar levels. The synthesis of boronic acid analogs of N-acyl- $\alpha$ -amino acids has yielded more effective inhibitors. Ac-borophe-OH, R-1-acetamido-2-phenylethane boronic acid, inhibits chymotrypsin with a  $K_i$  of 4  $\mu$ M Matteson et al. *J. Am. Chem. Soc.* 103: 5241 (1981). More recently, Shenvi, US 4,537,773 (1985) disclosed that boronic acid analogs of  $\alpha$ -amino acids, containing a free amino group, were effective inhibitors of aminopeptidases. Shenvi, US 4,499,082 (1985) discloses that peptides containing an  $\alpha$ -aminoboronic acid with a neutral side chain were more effective inhibitors of serine proteases exceeding inhibitors disclosed earlier by as much as 3 orders of magnitude in potency. The chemistry of  $\alpha$ -aminoboronic

acids was further expanded to the synthesis of peptide analogs containing boronic acid with positive charged sidechains, boroLysine, boroArginine, boroOrnithine, and isothiuronium analogs (EPA 0 293 881, 12/7/88). This series of compounds have provided highly effective inhibitors of thrombin and other trypsin-like enzymes. The boroArginine analogs specifically designed as thrombin inhibitors are highly effective in the inhibition of blood coagulation both in vitro and in vivo. In the present invention, this group of compounds is extended to aliphatic amidino and formamidino, to aromatic amidino and guanidino, to cyano and halogen, and to other neutral substituted aromatic boronic acid analogs.

It should be noted that additional boronic acids have been disclosed. Metternich (EP 0471651) have described peptides containing boroArginine and boroLysine which contain at least one unnatural amino acid residue. Elgendy et al. *Tetrahedron Lett.*, 33, 4209-4212 (1992) have described peptides containing  $\alpha$ -aminoboronic acids with aliphatic neutral sidechains which are thrombin inhibitors. Kakkar in (WO 92/07869) has claimed peptide thrombin inhibitors of the general structure,  $X-Aa_1-Aa_2-NH-CH(Y)-Z$  where  $Aa_1$  and  $Aa_2$  are unnatural amino acid residues.  $Z$  is  $-CN$ ,  $-COR$ ,  $-B(R^2)(R^3)$ ,  $-P(O)(R)(R)$ , and  $Y$  is  $-[CH_2]_n-Q$  or  $-CH_2-Ar-Q$  where  $Q = H$ , amino, amidino, imidazole, guanidino or isothioureido and  $n=1-5$  and where  $R_2$  and  $R_3$  are the same or different and are selected from the group consisting of  $OH$ ,  $OR^6$ , and  $NR^6R^7$ , or  $R^2$  and  $R^3$  taken together represent the residue of a diol. This specialized group of compounds where  $Z$  is  $-B(R^2)(R^3)$  fall within the scope of our present application. It should be noted that this is a narrow subset of Kakkar et al. However, rather specialized chemical transformations are required

to prepare these compounds and Kakkar et al. does not make an enabling disclosure.

Summary of the Invention

This invention also provides compositions comprising one or more of the foregoing compounds and methods of using such compositions in the treatment of aberrant proteolysis such as thrombosis in mammals or as

reagents used as anticoagulants in the processing of blood to plasma for diagnostic and other commercial purposes.

# 5 Detailed Description of the Invention

As used throughout the specifications, the following abbreviations for amino acid residues or amino acids apply:

	Ala	=	L-alanine
10	Arg	=	L-arginine
	Asn	=	L-asparagine
	Asp	=	L-aspartic acid
	Aze	=	azidine-2-carboxylic acid
	Cys	=	L-cysteine
15	Gln	=	L-glutamine
	Glu	=	L-glutamic acid
	Gly	=	glycine
	His	=	L-histidine
	HomoLys	=	L-homolysine
20	Ile	=	L-isoleucine
	Irg	=	isothiuronium analog of L-Arg
	Leu	=	L-leucine
	Lys	=	L-lysine
	Met	=	L-methionine
25	Orn	=	L-ornithine
	Phe	=	L-phenylalanine
	Pro	=	L-proline
	Ser	=	L-serine
	Thr	=	L-threonine
30	Trp	=	L-tryptophan
	Tyr	=	L-tyrosine
	Val	=	L-valine
	Sar	=	L-sarcosine
	Phe(4-fluoro)	=	para-fluorophenylalanine

35

The "D" prefix for the foregoing abbreviations indicates the amino acid is in the D-configuration. "D,L" indicates the amino is present in mixture of the D- and the L-configuration. The prefix "boro" indicates amino acid residues where the carboxyl is replaced by a boronic acid or a boronic acid ester. For example, if  $R^1$  is isopropyl and  $Y^1$  and  $Y^2$  are OH, the C-terminal residue is abbreviated "boroVal-OH" where "-OH" indicates the boronic acid is in the form of the free acid. The pinanediol boronic acid ester and the pinacol boronic acid ester are abbreviated "-C<sub>10</sub>H<sub>16</sub>" and "-C<sub>6</sub>H<sub>12</sub>", respectively. Examples of other useful diols for esterification with the boronic acids are 1,2-ethanediol, 1,3-propanediol, 1,2-propanediol, 2,3-butanediol, 1,2-diisopropylethanediol, 5,6-decanediol, and 1,2-dicyclohexylethanediol. The formamidino modified amino group is abbreviated (CH=NH). For example, the formamidino analog of -boroOrn-OH {-NH-CH[(CH<sub>2</sub>)<sub>3</sub>-NH-CH(NH)H]B(OH)<sub>2</sub>} is -boroOrn(CH=NH)-OH.

20 Analogs containing sidechain substituents are described by indicating the substituent in parenthesis following the name of the parent residue. For example the analog of borophenylalanine containing a meta cyano group is -borophe(mCN)-. N-alkyl substituents on the guanidino group of boroArg- or on the isothiuronium analogs (boroIrg) are also put in parenthesis in a similar manner. Other abbreviations are: Z, benzyloxycarbonyl; BSA, benzene sulfonic acid; THF, tetrahydrofuran; Boc-, t-butoxycarbonyl-; Ac-, acetyl; pNA, p-nitro-aniline; DMAP, 4-N,N-dimethylaminopyridine; Tris, Tris(hydroxymethyl)aminomethane; MS, mass spectrometry; FAB/MS, fast atom bombardment mass spectrometry. LRMS(NH<sub>3</sub>-CI) and HRMS(NH<sub>3</sub>-CI) are low and high resolution mass spectrometry, respectively, using NH<sub>3</sub> as an ion source.

The compounds herein described may have asymmetric centers. All chiral, diastereomeric, and racemic forms are included in the present invention. Many geometric isomers of olefins, C=N double bonds, and the like can also be present in the compounds described herein, and all such stable isomers are contemplated in the present invention. It will be appreciated that certain compounds of the present invention contain an asymmetrically substituted carbon atom, and may be isolated in optically active or racemic forms. It is well known in the art how to prepare optically active forms, such as by resolution of racemic forms or by synthesis, from optically active starting materials. Also, it is realized that cis and trans geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms. All chiral, diastereomeric, racemic forms and all geometric isomeric forms of a structure are intended, unless the specific stereochemistry or isomer form is specifically indicated.

products at the temperatures at which the reactions are carried out. A given reaction may be carried out in one solvent or a mixture of more than one solvent.

Depending on the particular reaction step, suitable  
5 solvents for a particular reaction step may be selected.

When any variable (for example,  $R^{11}$ ,  $R^{12}$ ,  $R^{13}$ ,  $R^{14}$ ,  $m$ , etc.) occurs more than one time in any constituent or formula for a compound, its definition on each occurrence is independent of its definition at every  
10 other occurrence. Thus, for example, if a group is shown to be substituted with 0-3  $R^{11}$ , then said group may optionally be substituted with up to three  $R^{11}$  and  $R^{11}$  at each occurrence is selected independently from the defined list of possible  $R^{11}$ . Also, combinations of  
15 substituents and/or variables are permissible only if such combinations result in stable compounds. By stable compound or stable structure it is meant herein a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction  
20 mixture. Similarly, by way of example, for the group  $-C(R^{11})_2-$ , each of the two  $R^{11}$  substituents on C is independently selected from the defined list of possible  $R^{11}$ .

When a bond to a substituent is shown to cross the  
25 bond connecting two atoms in a ring, then such substituent may be bonded to any atom on the ring. When a substituent is listed without indicating the atom via which such substituent is bonded to the rest of the compound of a given formula, then such substituent may  
30 be bonded via any atom in such substituent. For example, when the substituent is piperazinyl, piperidinyl, or tetrazolyl, unless specified otherwise, said piperazinyl, piperidinyl, tetrazolyl group may be bonded to the rest of the compound of a given formula  
35 via any atom in such piperazinyl, piperidinyl, tetrazolyl group.

Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds. By stable compound or stable structure it is meant herein a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

"NH<sub>2</sub>-blocking group" as used herein, refers to various acyl, thioacyl, alkyl, sulfonyl, phosphoryl, and phosphinyl groups comprised of 1 to 20 carbon atoms. Substitutes on these groups maybe either alkyl, aryl, alkylaryl which may contain the heteroatoms, O, S, and N as a substituent or in-chain component. A number of NH<sub>2</sub>-blocking groups are recognized by those skilled in the art of organic synthesis. By definition, an NH<sub>2</sub>-blocking group may be removable or may remain permanently bound to the NH<sub>2</sub>. Examples of suitable groups include formyl, acetyl, benzoyl, trifluoroacetyl, and methoxysuccinyl; aromatic urethane protecting groups, such as, benzyloxycarbonyl; and aliphatic urethane protecting groups, such as t-butoxycarbonyl or adamantyloxycarbonyl. Gross and Meinhofer, eds., *The Peptides*, Vol 3; 3-88 (1981), Academic Press, New York, and Greene and Wuts *Protective Groups in Organic Synthesis*, 315-405 (1991), J. Wiley and Sons, Inc., New York disclose numerous suitable amine protecting groups and they are incorporated herein by reference for that purpose. Amine protecting groups may include, but are not limited to the following: 2,7-di-t-butyl-[9-(10,10-dioxo-10,10,10,10-tetrahydrothioxanthyl)]methyloxycarbonyl; 2-trimethylsilylethyloxycarbonyl; 2-phenylethyloxycarbonyl; 1,1-dimethyl-2,2-dibromoethyloxycarbonyl; 1-methyl-1-(4-biphenyl)ethyloxycarbonyl; benzyloxycarbonyl; p-nitrobenzyloxycarbonyl; 2-(p-

- toluenesulfonyl)ethyloxycarbonyl; m-chloro-p-acyloxybenzyloxycarbonyl; 5-benzyisoxazolylmethyloxycarbonyl; p-(dihydroxyboryl)benzyloxycarbonyl; m-
- 5 nitrophenyloxycarbonyl; o-nitrobenzyloxycarbonyl; 3,5-dimethoxybenzyloxycarbonyl; 3,4-dimethoxy-6-nitrobenzyloxycarbonyl; N'-p-toluenesulfonylamino carbonyl; t-amylloxycarbonyl; p-decyloxybenzyloxycarbonyl; diisopropylmethyloxycarbonyl;
- 10 2,2-dimethoxycarbonylvinyloxycarbonyl; di(2-pyridyl)methyloxycarbonyl; 2-furanylmethyloxycarbonyl; phthalimide; dithiasuccinimide; 2,5-dimethylpyrrole; benzyl; 5-dibenzylsuberyl; triphenylmethyl; benzylidene; diphenylmethylene; or methanesulfonamide.
- 15 "Amino acid residues" as used herein, refers to natural, modified or unnatural amino acids of either D- or L-configuration and means an organic compound containing both a basic amino group and an acidic carboxyl group. Natural amino acids residues are Ala,
- 20 Arg, Asn, Asp, Aze, Cys, Gln, Glu, Gly, His, Ile, Irg, Leu, Lys, Met, Orn, Phe, Phe(4-fluoro), Pro, Sar, Ser, Thr, Trp, Tyr, and Val. Roberts and Vellaccio, The Peptides, Vol 5; 341-449 (1983), Academic Press, New York, discloses numerous suitable unnatural amino acids
- 25 and is incorporated herein by reference for that purpose. Additionally, said reference describes, but does not extensively list, acyclic N-alkyl and acyclic  $\alpha,\alpha$ -disubstituted amino acids. Included in the scope of the present invention are N-alkyl, aryl, and alkylaryl
- 30 analogs of both in chain and N-terminal amino acid residues. Similarly, alkyl, aryl, and alkylaryl maybe substituted for the alpha hydrogen. Illustrated below are examples of N-alkyl and alpha alkyl amino acid residues, respectively.

Unnatural amino acids that fall within the scope of this invention are by way of example and without limitation:

2-aminobutanoic acid, 2-aminopentanoic acid, 2-aminohexanoic acid, 2-aminoheptanoic acid, 2-amino-octanoic acid, 2-aminononanoic acid, 2-aminodecanoic acid, 2-aminoundecanoic acid, 2-amino-3,3-dimethylbutanoic acid, 2-amino-4,4-dimethylpentanoic acid, 2-amino-3-methylhexanoic acid, 2-amino-3-methylheptanoic acid, 2-amino-3-methyloctanoic acid, 2-amino-3-methylnonanoic acid, 2-amino-4-methylhexanoic acid, 2-amino-3-ethylpentanoic acid, 2-amino-3,4-dimethylpentanoic acid, 2-amino-3,5-dimethylhexanoic acid, 2-amino-3,3-dimethylpentanoic acid, 2-amino-3-ethyl-3-methylpentanoic acid, 2-amino-3,3-diethylpentanoic acid, 2-amino-5-methylhexanoic acid, 2-amino-6-methylheptanoic, 2-amino-7-methyloctanoic, 2-amino-2-cyclopentylacetic, 2-amino-2-cyclohexylacetic acid, 2-amino-2-(1-methylcyclohexyl)acetic acid, 2-amino-2-(2-methyl-1-methylcyclohexyl)acetic acid, 2-amino-2-(3-methyl-1-methylcyclohexyl)acetic acid, 2-amino-2-(4-methyl-1-methylcyclohexyl)acetic acid, 2-amino-2-(1-ethylcyclohexyl)acetic acid, 2-amino-3-(cyclohexyl)propanoic acid, 2-amino-4-(cyclohexyl)butanoic acid, 2-amino-3-(1-adamantyl)propanoic acid, 2-amino-3-butenic acid, 2-amino-3-methyl-3-butenic acid, 2-amino-4-pentenoic acid, 2-amino-4-hexenoic acid, 2-amino-5-heptenoic acid, 2-amino-4-methyl-4-hexenoic acid, 2-amino-5-methyl-4-hexenoic acid, 2-amino-4-methyl-5-hexenoic acid, 2-amino-

       "Amino acids residues" also refers to various amino  
       acids where sidechain functional groups are coupled with  
       appropriate protecting groups known to those skilled in  
       the art. "The Peptides", Vol 3, 3-88 (1981) discloses  
       numerous suitable protecting groups and is incorporated  
       herein by reference for that purpose.

35 represents an alkyl group of indicated number of carbon atoms attached through an oxygen bridge; "cycloalkyl" is

intended to include saturated ring groups, including mono-, bi- or poly-cyclic ring systems, such as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, adamantyl and cyclooctyl; and "biycloalkyl" is intended to include saturated bicyclic ring groups such as [3.3.0]bicyclooctane, [4.3.0]bicyclononane, [4.4.0]bicyclodecane (decalin), [2.2.2]bicyclooctane, and so forth. "Alkenyl" is intended to include hydrocarbon chains of either a straight or branched configuration and one or more unsaturated carbon-carbon bonds which may occur in any stable point along the chain, such as ethenyl, propenyl, and the like; and "alkynyl" is intended to include hydrocarbon chains of either a straight or branched configuration and one or more triple carbon-carbon bonds which may occur in any stable point along the chain, such as ethynyl, propynyl and the like.

The terms "-(alkyl)-", "-(alkylenyl)-", "-(phenyl)-", and the like, refer to alkyl, alkenyl, and phenyl groups, respectively, which are connected by two bonds to the rest of the structure of Formula (II). Such groups may alternatively and equivalently be denoted as "alkylene", "alkenylene", "phenylene", and the like, respectively.

"Halo" or "halogen" as used herein refers to fluoro, chloro, bromo, and iodo; and "counterion" is used to represent a small, negatively charged species such as chloride, bromide, hydroxide, acetate, sulfate, and the like.

As used herein, "aryl" or "aromatic residue" is intended to mean phenyl or naphthyl; the term "arylalkyl" represents an aryl group attached through an alkyl bridge. By way of examples: the term "C<sub>7</sub>-C<sub>10</sub> arylalkyl" is intended to refer to an aryl group attached through a C<sub>1</sub>-C<sub>4</sub> alkyl bridge to the residue of the indicated compound; the term "(C<sub>1</sub>-C<sub>3</sub> alkyl)aryl" is

intended to refer to a C<sub>1</sub>-C<sub>3</sub> alkyl group which is attached through an aryl ring to the residue of the indicated compound; the term "aryl(C<sub>1</sub>-C<sub>3</sub> alkyl)" is intended to refer to an aryl group attached through a C<sub>1</sub>-C<sub>3</sub> alkyl group to the residue of the indicated compound.

As used herein, "carbocycle" or "carbocyclic residue" is intended to mean any stable 3- to 7-membered monocyclic or bicyclic or 7- to 14-membered bicyclic or tricyclic or an up to 26-membered polycyclic carbon ring, any of which may be saturated, partially unsaturated, or aromatic. Examples of such carbocycles include, but are not limited to, cyclopropyl, cyclopentyl, cyclohexyl, phenyl, biphenyl, naphthyl, indanyl, adamantyl, or tetrahydronaphthyl (tetralin).

As used herein, the term "heterocycle" is intended to mean a stable 5- to 7-membered monocyclic or bicyclic or 7- to 10-membered bicyclic heterocyclic ring which is either saturated or unsaturated, and which consists of carbon atoms and from 1 to 4 heteroatoms independently selected from the group consisting of N, O and S and wherein the nitrogen and sulfur heteroatoms may optionally be oxidized, and the nitrogen may optionally be quaternized, and including any bicyclic group in which any of the above-defined heterocyclic rings is fused to a benzene ring. The heterocyclic ring may be attached to its pendant group at any heteroatom or carbon atom which results in a stable structure. The heterocyclic rings described herein may be substituted on carbon or on a nitrogen atom if the resulting compound is stable. Examples of such heterocycles include, but are not limited to, 1H-indazole, 2-pyrrolidonyl, 2H,6H-1,5,2-dithiazinyl, 2H-pyrrolyl, 3H-indolyl, 4-piperidonyl, 4aH-carbazole, 4H-quinolizinyll, 6H-1,2,5-thiadiazinyl, acridinyl, azocinyl, benzofuranyl, benzothiophenyl, carbazole, chromanyl,

chromenyl, cinnolinyl, decahydroquinolinyl, furanyl, furazanyl, imidazolidinyl, imidazolinyl, imidazolyl, indolinyl, indoliziny, indolyl, isobenzofuranyl, isochromanyl, isoindolinyl, isoindolyl, isoquinolinyl  
5 (benzimidazolyl), isothiazolyl, isoxazolyl, morpholinyl, naphthyridinyl, octahydroisoquinolinyl, oxazolidinyl., oxazolyl, phenanthridinyl, phenanthrolinyl, phenarsazinyl, phenazinyl, phenothiazinyl, phenoxathiinyl, phenoxazinyl, phthalazinyl, piperazinyl,  
10 piperidinyl, pteridinyl, purinyl, pyranyl, pyrazinyl, pyrazolidinyl, pyrazolinyl, pyrazolyl, pyridazinyl, pyridinyl, pyridyl, pyrimidinyl, pyrrolidinyl, pyrrolinyl, pyrrolyl, quinazolinyl, quinolinyl, quinoxalinyl, quinuclidinyl, carbolinyl,  
15 tetrahydrofuranyl, tetrahydroisoquinolinyl, tetrahydroquinolinyl, tetrazolyl, thianthrenyl, thiazolyl, thienyl, thiophenyl, triazinyl, xanthenyl. Also included are fused ring and spiro compounds containing, for example, the above heterocycles.

20 Preferred heterocycles include, but are not limited to, pyridinyl, furanyl, thienyl, pyrrolyl, pyrazolyl, imidazolyl, indolyl, benzimidazolyl, 1H-indazolyl, oxazolidinyl, benzotriazolyl, benzisoxazolyl, oxindolyl, benzoxazolinyl, or isatinoyl.

25 The term "substituted", as used herein, means that any one or more hydrogens on the designated atom is replaced with a selection from the indicated group, provided that the designated atom's normal valency is not exceeded, and that the substitution results in a  
30 stable compound. When a substituent is keto (i.e., =O), then 2 hydrogens on the atom are replaced.

The term "peptide" as used herein means a compound that consists of two or more amino acids (as defined herein) that are linked by means of a peptide bond. The  
35 term "peptide" also includes compounds containing both peptide and non-peptide components, such as

pseudopeptide or peptide mimetic residues or other non-amino acid components. Such a compound containing both peptide and non-peptide components may also be referred to as a "peptide analog".

5       The term "peptide bond" means a covalent amide linkage formed by loss of a molecule of water between the carboxyl group of one amino acid and the amino group of a second amino acid.

As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic residues such as amines; 10 alkali or organic salts of acidic residues such as carboxylic acids; and the like. The pharmaceutically acceptable salts include the conventional non-toxic salts or the quaternary ammonium salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, nitric and the like; and the salts prepared from organic acids such as acetic, propionic, succinic, 15 glycolic, stearic, lactic, malic, tartaric, citric, ascorbic, pantoic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, isethionic, 20 and the like.

The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound which contains a basic or acidic moiety by conventional chemical methods. Generally, such salts 25 can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the

appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of  
5 suitable salts are found in *Remington's Pharmaceutical Sciences*, 17th ed., Mack Publishing Company, Easton, PA, 1985, p. 1418, the disclosure of which is hereby incorporated by reference.

The phrase "pharmaceutically acceptable" is  
10 employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals, without excessive toxicity, irritation, allergic  
15 response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.

### Synthesis

Novel peptide boronic acids containing aliphatic  
20 sidechains were prepared by the series of reactions outlined in Scheme I. First, the precursor,  $\text{NH}_2\text{-CH}[(\text{CH}_2)_n\text{Br}]\text{BO}_2\text{-C}_{10}\text{H}_{16}$ ,  $n = 3$  or  $4$ , was prepared and coupled with an N-terminal protecting group or with an N-terminal and sidechain protected peptide by the  
25 procedure we have described previously [Kettner et al. *J. Biol. Chem.* 265 18289-18297 (1990)]. An example of this product is 1 where the above intermediate is coupled to Ac-(D)Phe-Pro-OH. 1 was converted to the corresponding alkyl cyanide 2 by treatment with  
30 tetrabutyl ammonium cyanide in THF at 55 °C for 2 hours. This appears to be a general method for introducing the cyano group. In contrast, other common methods of introducing this group can be applied only with limited success. For example, the reaction of Ac-(D)Phe-Pro-NH-  
35  $\text{CH}[(\text{CH}_2)_4\text{-Br}]\text{BO}_2\text{-C}_{10}\text{H}_{16}$  with KCN in N,N-dimethylformamide failed to yield a detectable product.

Our data are consistent with the formation of a cyclic product arising from the nucleophilic displacement of the sidechain bromide by the adjacent amide NH. Treatment of Z-NH-CH[(CH<sub>2</sub>)<sub>4</sub>-Br]BO<sub>2</sub>-C<sub>10</sub>H<sub>16</sub> with NaCN in N,N-dimethylformamide gave the cyano compound, but only in low yield, indicating that cyclization does not occur quite so readily when the urethane protecting group (Z) is present. Typically, 2 was purified by standard techniques such as silica gel chromatography. The corresponding amidine, 3, was prepared by treating the nitrile with a saturated solution of a mineral acid such as HCl in methanol. Excess solvent and acid were removed by evaporation and the residue was allowed to react with anhydrous ammonia to yield the desired product.

Scheme 1

The formamidino substituted boronic acid, 5, was prepared by the synthesis of the corresponding alkyl amine such as Ac-(D)Phe-Pro-boroOrn-C<sub>10</sub>H<sub>16</sub> 4, Scheme 2.

This in turn was prepared by treating 1 with sodium azide followed by hydrogenation (Kettner et al., 1990). The amine, 4, was treated with ethyl formimidate to yield the formamidino compound, 5.

5

## Scheme 2

N-substituted isothiuronium derivatives and N-substituted guanidines are readily prepared as shown in Scheme 2a. Treatment of bromide 1 with a thiourea produces directly the isothiuronium 21. Alternatively 1 can be converted to the amine 4 as shown in Scheme 2. Employing a method originally described by Kim et al., *Tetrahedron Lett.* 29, 3183 (1988), the amine 4 then is heated with a formamidinesulfonic acid in the presence of 4-DMAP to afford the guanidine 22. The required formamidinesulfonic acids can be prepared by oxidation of the corresponding thioureas, see: Walter and Randau, *Liebigs Ann. Chem.* 722, 98 (1969).

Scheme 2a

The substituted boronic acid, 7, is prepared by treating 4 with dimethyl cyanodithioiminocarbonate or diphenyl cyanodicarbonimiate to yield the S-methyl isourea (6) or O-phenyl isourea, respectively, using a procedure similar to that reported by Barpill et al. *J. Heterocyclic Chem.* 25, 1698 (1988), Scheme 3. This intermediate is treated with ammonia in either THF or alcohol to yield the desired product.

Scheme 3

Hydroxyguanidino inhibitors are prepared by treating 4 with cyanogen bromide or cyanogen chloride followed by hydroxylamine to yield 8, Scheme 4. These are known chemical transformations, Nakahara et al. *Tetrahedron*, 33, 1591 (1977) and Belzecki et al. *J. Chem. Soc. Chem. Commun.*, 806 (1970).

Scheme 4.

10

The preparation of new aromatic boronic acids are shown in Scheme 5. Functionalized benzylic anions containing either a halogen or cyano substituent (the cyano group is shown for illustration) are obtained by treatment with activated Zn metal in THF or other inert solvent and then with CuCN·2LiCl [Berk et al. *Organometallics* 9, 3053-3064 (1990)]. Dichloromethyl boronic acid pinanediol was prepared by the method described by Tsai et al. *Organometallics* 2, 1543-1545 (1983). It was allowed to react with the transmetalated anion to yield 9. This was the only acceptable method of preparing these functionalized benzylic anions. For example, treatment of *p*-nitobenzyl chloride with lithium metal using the method of Michel et al. *J. Organometallic Chem.* 204, 1-12 (1981) failed to yield an identifiable product. Similarly, treatment of *p*-cyanobenzyl chloride with lithium naphthalenide in the presence of ZnCl<sub>2</sub> using the conditions of Zhu et al. *J. Org. Chem.* 56, 1445-1453 (1991) did not give the desired product.

The  $\alpha$ -aminoboronic acid, 10, was obtained by treating 9 with the lithium salt of hexamethyldisilazane and removing the trimethylsilanyl groups by treatment with anhydrous HCl. 10 was coupled to either an N-terminal protecting group or to a peptide using known techniques.

The aromatic substituted cyanides, 11, were converted to the corresponding amidino compound, 12, using the same sequence of reactions described for preparation of the aliphatic amidino compound, 3.

Scheme 5

11 can be hydrogenated to yield the corresponding aminomethyl group as an aromatic substituent 13, Scheme 6. The corresponding formamidino, cyanoguanidino, hydroxyguanidino and guanidino compounds, 14, 15, 16,

and 17, respectively, are prepared by the procedures described for the aliphatic series, Scheme 1.

Scheme 6

Aromatic guanidino inhibitors, 20, were prepared from precursor R-boroPhe-C<sub>10</sub>H<sub>16</sub>, Scheme 7. The aromatic ring was nitrated by reaction with NO<sup>+</sup>BF<sub>4</sub><sup>-</sup> to yield 18 which was reduced to the corresponding amine, 19. The  
5 amine is converted to the guanidine by reaction with aminoiminomethane sulfonic acid [Mosher et al. *Tetrahedral Lett.* 29 3183 (1988)] or cyanamide (Kettner et al. 1990).

Scheme 7

Scheme 8 illustrates the preparation of thrombin inhibitors where the P<sub>1</sub> side chain is substituted with an alkoxy group, and where the N-terminus is derivatized with novel N-blocking groups. Treatment of R<sup>3</sup>-[A]<sub>n</sub>-NH-CH[(CH<sub>2</sub>)<sub>3</sub>-Br]BO<sub>2</sub>-C<sub>10</sub>H<sub>16</sub> with an alkoxide yielded the ether 20 in the P<sub>1</sub> site, as shown for Boc-(D)Phe-Pro-NH-

CH[(CH<sub>2</sub>)<sub>3</sub>-Br]BO<sub>2</sub>-C<sub>10</sub>H<sub>16</sub> 1. Removal of the Boc protecting group yielded the free amine 23 which was further modified to give inhibitors with unique properties. The inhibitor 23 was obtained by reductive amination with glyoxylic acid and sodium cyanoborohydride using a procedure similar to the general described by Rosowsky J. Med. Chem. 34, 1447, 1991. Similarly, reductive amination with formaldehyde yielded the N,N-dimethyl analog 24.

Scheme 8.

15 The boroOrn ester 4 was the starting material inhibitors with side chain amides (26), sulfonamides (27),  $\alpha$ -hydroxyamides (28) and ureas (29) at the P<sub>1</sub> side chain (Scheme 9). The latter compounds were obtained by

treatment of 4 with potassium cyanate in alcohol using conditions similar to those described by Frimpong-Manso et al. J. Heterocyclic Chem. 29, 221, 1992. Scheme 9.

5

Inhibitors of this invention with modified guanidino groups at P<sub>1</sub> were prepared using procedures described previously for the preparation of Cimetidine (Durant et al. J. Med. Chem. 20, 901, 1977) (Scheme 10). 4 was reacted with dimethylcyanodithio-imidocarbonate to give 31. Treatment of 31 with either ammonia, an alkyl amine, or an N,N-dialkyl amine yielded the corresponding cyanoguanidine (32a), N-alkyl cyanoguanidine (32b), and N,N-dialkyl cyanoguanidine (32c), respectively. The peptide portion of the molecule was modified to yield a variety of inhibitors. For example, when R<sup>3</sup> of 32 was Boc, treatment with anhydrous HCl gave a free amino

group which was carboxymethylated with HCOCOOH and NaCNBH<sub>3</sub>.

Scheme 11 shows the preparation of inhibitors wherein X is an aminooxy or guanidinooxy group. These were prepared according to the general procedure described by Martin et al J. Med. Chem. 8, 456, 1965. The alkyl halide 1 was allowed to react with N-hydroxyphthalimide in DMF in the presence of triethylamine at 100°C to yield 34. The phthalamido group was removed by treatment with hydrazine in methylene chloride and methanol to give the aminooxy compound 35. The aminooxy group of 35 was converted to the guanidinooxy group of 36 by heating with cyanamide in toluene. Other methods of guanidation described in

the present case can also applied here to form the desired compound 36.

Scheme 12 illustrates the preparation of boronic acid analogs containing a substituted cyclohexyl ring in the  $\text{P}_1$  site. Cyclohexadione monoethylene ketone 38 was converted to the alkene 39 using a Wittig reaction. 39 was hydroboronated using diisopinocampyl borane and converted to the boronic acid ethyl ester using the

general procedure described by Brown et al. J. Org. Chem. 47, 5065, 1982. Transesterification with pinanediol gave 40. The  $\alpha$ -chloro compound 41 was prepared by the homologation reaction of 40 with the  
5 anion of methylene chloride using the procedure of Matteson et al. J. Am. Chem. Soc. 105, 2077, 1983. Nucleophilic displacement of the  $\alpha$ -chloride with the lithium salt of hexamethyldisilazane gave the bis-silyl protected amine 42. The trimethylsilyl protecting  
10 groups were removed by treatment with anhydrous HCl. The  $\alpha$ -amino group was coupled to either an acyl group or N-protected peptide or amino acid using the mixed anhydride or other standard peptide coupling reaction conditions. The peptide 43 was treated with an aqueous  
15 suspension of a sulfonic acid substituted ion exchange resin to yield the side chain ketone which was converted to the amino cyclohexylpeptide 44 by reductive amination using ammonium acetate and sodium cyanoborohydride.

Scheme 12.

5 Scheme 13 shows the preparation of boronic acid peptides containing a cyclohexyl residue in the P<sub>1</sub> site by a modified procedure for the preparation of 44. The

ketal, 47, was prepared by the procedure of Laronze  
 Synthetic Communications 21 881, 1991. Hydroboration and  
 transesterification with R-pinenediol yielded both the  
 1,4- (48) and 1,3-disubstituted (49) boronic acid  
 5 esters. 48 was converted to the corresponding amine 50  
 using the reaction pathway described for 44.

Scheme 13.

10

Compounds of the invention where R1 is an  
 alkylcyclohexyl group and X is a hydroxide, formamidine,  
 or guanidine were prepared according to Scheme 14.  
 15 Compound 52 was prepared from 43 by treatment of 43 with  
 a sulfonic acid substituted ion exchange resin. 52 was  
 converted to 53 by reduction with NaBH<sub>4</sub>. To form the  
 guanidino substituted compound 55, 50 was treated with

aminoiminomethane sulfonic acid according to Scheme 7. The formamidino analog 56 was prepared by treatment of 50 with ethyl formimidate according to Scheme 6.

- 5 Compounds of the present invention where  $\text{R}^1$  is a substituted benzyl group and E is a nonboronic acid/ester electrophilic group, such as  $-\text{CO}_2\text{CH}_3$ ,  $-\text{CHO}$ ,  $-\text{CO}_2\text{H}$ , and  $-\text{CON}(\text{CH}_3)\text{OCH}_3$ , were prepared according to Scheme 15 from the corresponding substituted
- 10 phenylalanine ester 61 by following the procedure described by Schmidt et al Synthesis 53, 1984. Accordingly, 57 was catalytically hydrogenated with Pd/C to 58 which was coupled to  $\text{R}^3\text{-[A]}_n\text{-OH}$ , under standard peptide forming conditions, to form 59. Treatment of 59
- 15 with the substituted aldehyde 65 in the presence of lithium diisopropylamine yielded 60. Hydrogenation of 60 in the presence of a chiral catalyst, such as Duphos<sup>TM</sup>, gave 61. Either the R or S isomer could be obtained by the stereo specific hydrogenation of 60
- 20 according to the procedure of Burk et al J. Am. Chem. Soc. 115, 10125, 1993. 61 was then converted to the aldehyde 62 by treatment with diisobutyl aluminum hydride. The acid 63 was made from 61 by treatment with aqueous base. 63 was then converted to 64 by treatment
- 25 of the mixed anhydride of 63 with N-methoxy-N-methylamine. 63 can also be readily reduced with  $\text{LiAlH}_4$  to give the corresponding peptide aldehyde 62 according

to the procedure of Nahm and Weinreb Tetrahedron Lett  
22, 3815, 1981.

Scheme 15.

Inhibitors of the invention wherein E is  
-COC(=CH<sub>2</sub>)OEt, -COCOEt, -COCO<sub>2</sub>H, -COCOCH<sub>3</sub>, OR  
-COCONR<sup>15</sup>R<sup>16</sup> are prepared according to Scheme 16 by  
5 following the procedure of Angelastro et al. J. Org.  
Chem. 54, 3913, 1989. Thus 64 was converted to the  
corresponding vinyl ketone 67 by treatment with the  
lithium salt of ethyl vinyl ether. The ketone ethyl  
ester 68 is obtained by ozonolysis of the double bond.  
10 The corresponding carboxylic acid 69 is obtained by base  
hydrolysis of 68. Acid hydrolysis of 70 gives the  
diketone 70. The corresponding amides are prepared  
using the procedure described by Li et al. J. Med. Chem.  
36 3472, 1993. The keto function of the keto ethyl  
15 ester 71 is protected as the 1,3-dithiolane 72 and  
treated with either ammonia, a primary, or secondary  
amine to give corresponding keto amides 73. The  
bisketo-carboxylic acid esters of this invention are  
prepared by the procedure of Wasserman and Vu  
20 Tetrahedron Lett. 31, 5205, 1990.

Scheme 16.

Scheme 17 shows the preparation of nonboronic acid inhibitors wherein E is an  $\alpha$ -ketobenzoxazoline 75,

oxazoline 76,  $\alpha$ -diazoketone 77,  $\alpha$ -monohaloketone 78, and  $\alpha$ -trihalomethylketone 79. Thus according to the procedure of Edwards et al J. Am. Chem. Soc. 114, 1855, 1992, 75 and 76 are prepared from 62. 77 is prepared by  
5 treatment of the mixed anhydride of 63 with diazomethane using the general procedure of Kettner and Shaw Methods Enzymol. 80, 826, 1981. 77 is then converted to 78 by reaction with an acid halide using the procedure described by Angliker et al. Biochem J. 241, 871, 1987.  
10 79 is prepared from 63 by a modification of the Dakin-West reaction (Dakin and West J. Biol. Chem. 78, 91, 1928) described by Kolb et al Tetrahedron Lett. 27 1579, 1986.

Scheme 17.

In an alterante synthesis, the trifluoromethyl ketone analog 85 was prepared using a procedure similar to that described by Imperial and Abeles Tetrahedron Lett. 27, 135, 1986. (Scheme 18) *m*Cyanobenzaldehyde was condensed with nitromethane to give the nitrostyrene 81 which was reduced with  $\text{NaBH}_4$  using the method

Bhattachariya et al. Synthesis 886, 1985. The anion of the nitroalkane was added to the ethyl hemiacetal of

trifluoroacetaldehyde to yield 82. The nitro group of 82 was selectively reduced to give the  $\alpha$ -amino alcohol 83 using  $\text{Na}_2\text{S}_2\text{O}_3$ . 83 is then coupled to an N-protected amino acid or peptide to give 84 which was then oxidized to the trifluoromethyl ketone 85.

NMR, proton nuclear magnetic resonance, chemical shifts are reported in  $\delta$  units, parts per million downfield from the internal tetramethylsilane standard. Elemental analyses were conducted by Galbraith Laboratories Inc., Knoxville, TN and Microanalysis Inc., Wilmington, DE. FAB/MS samples of free boronic acids did not give consistent results making it difficult to monitor the removal of ester protecting groups by this means. However, the presence of the pinanediol and the pinacol groups are readily observed in NMR spectra. For the pinanediol ester, a methyl group is observed at  $\delta$  0.9 and the methyl groups of the pinacol groups are observed as singlet at  $\delta$  1.1. Following the removal of pinanediol protecting group, MS were run by treating the sample with ~2 equivalents of pinacol in methanol for 5 minutes and evaporating the solvent. Similarly, MS samples of free boronic acid, obtained by removal of the pinacol, were prepared by treating with pinanediol. In some cases, ethylene glycol was used as a matrix for mass spectroscopy to yield the boronic acid-ethyleneglycol ester (designated EG ester). For the subsequent Example see Table 1 for analytical data.

##### 25 Synthesis of Ac-(D)Phe-Pro-NH-CH[(CH<sub>2</sub>)<sub>4</sub>CN]BO<sub>2</sub>-C<sub>10</sub>H<sub>16</sub>

The intermediate, Ac-(D)Phe-Pro-NH-CH[(CH<sub>2</sub>)<sub>4</sub>Br]BO<sub>2</sub>-C<sub>10</sub>H<sub>16</sub>, was prepared using the mixed anhydride procedure. Ac-(D)Phe-Pro-OH (3.04 g, 10 mmol) was dissolved in 50 mL of THF and N-methylmorpholine (1.1 mL, 10 mmol) was added. The solution was cooled to -20°C using a CCl<sub>4</sub> dry ice bath and isobutyl chloroformate (1.30 mL, 10 mmol) was added. After 5 min at -20°C, the mixture was added to NH<sub>2</sub>-CH[(CH<sub>2</sub>)<sub>4</sub>Br]BO<sub>2</sub>-C<sub>10</sub>H<sub>16</sub>•HCl (3.81 g, 10 mmol) which was dissolved in 20 mL of THF and precooled to -20°C. Triethylamine (1.39 mL, 10 mmol) was added and the mixture was allowed to stir

for 1 h at  $-20^{\circ}\text{C}$  and 2 h at room temperature. Insoluble material was removed by filtration and the filtrate was evaporated under a reduced pressure. The residue was dissolved in 50 mL of ethyl acetate and washed subsequently with 75 mL of 0.2 N HCl, 5%  $\text{NaHCO}_3$ , and saturated aqueous sodium chloride. The organic phase was dried over  $\text{Na}_2\text{SO}_4$  and concentrated in vacuo to give Ac-(D)Phe-Pro-NHCH[( $\text{CH}_2$ ) $_4$ Br] $\text{BO}_2\text{-C}_{10}\text{H}_{16}$  (6.01 g, 95% yield).

10 The bromide (1.89 g, 3.0 mmol) and tetra-n-butyl ammonium cyanide (3.2 g, 11.8 mmol, 4 eq) were dissolved in 50 mL of acetonitrile. This solution was heated at  $90^{\circ}\text{C}$  for 3 h and solvent was removed under reduced pressure. The residue was dissolved in 50 mL of ethyl acetate and was washed with three 50 mL portions of saturated aqueous NaCl. The ethyl acetate solution was dried over anhydrous  $\text{Na}_2\text{SO}_4$  and evaporated to give 2.5 g of crude product. It was purified by silica gel chromatography using 5% MeOH in  $\text{CHCl}_3$  as an eluent to yield the desired product (0.50 g, 29% yield).

The nitrile, (Example 1, 0.40 g, 0.70 mmol), was dissolved in 50 mL of a cold solution of saturated HCl in methanol and the solution was stirred overnight at  $4^{\circ}\text{C}$ . The solution was then concentrated under reduced pressure. The residue was dissolved in anhydrous methanol (50 mL), gaseous  $\text{NH}_3$  was bubbled through the solution for 1 h, and the solution was heated at  $50^{\circ}\text{C}$  for 3 h. Solvent was evaporated, the residue was suspended in minimum volume of methanol, and 0.11 g of

benzenesulfonic acid (1 eq) was added. Methanol was evaporated and the residue was triturated with hexane to yield the desired product as a pale yellow powder (0.52 g, 99 % yield).

The first intermediate, Cl-CH[CH<sub>2</sub>-(m-  
cyanophenyl)]BO<sub>2</sub>-C<sub>10</sub>H<sub>16</sub>, was prepared from m-cyanobenzyl  
15 bromide and dichloromethyl boronate pinanediol. Zinc

solution of m-cyanobenzyl bromide (1.37 g, 7.0 mmol) in  
7 mL of THF was added dropwise (5 sec/drop). The  
reaction mixture was allowed to stir at 5°C for 2 h. A

g, 7.0 mmol), and 6 mL of THF was placed in a 50 mL  
flask and cooled to -40°C; then the benzylic organozinc  
reagent was added by cannulation. The mixture was  
allowed to warm to -20°C and stir for 5 min. It was  
25 cooled to -78°C and neat dichloromethyl boronic acid  
pinanediol (1.47 g, 5.6 mmol) was added dropwise. The  
resulting mixture was stirred at -78°C for 2 h and at  
room temperature for 2 days. Saturated aqueous NH<sub>4</sub>Cl  
(20 mL) was added to the mixture and the aqueous  
30 solution was extracted with three 20 mL portions of  
ether. The combined organic layers was dried over  
anhydrous MgSO<sub>4</sub> and evaporated in vacuo to give crude  
compound (1.8 g). It was purified by silica gel

To a solution of hexamethyldisilazane (0.21 mL, 0.98 mmol) in 2 mL of THF at  $-78^\circ C$  was added n-butyllithium (1.45 M, 0.67 mL, 0.98 mmol). The solution was allowed to slowly warm to room temperature to ensure the anion generation was complete. The resulting solution was then cooled to  $-78^\circ C$  and Cl-CH( $CH_2$ -(*m*-cyanophenyl)) $BO_2$ - $C_{10}H_{16}$  (0.33 g, 0.98 mmol) in 2 mL of THF was added. The mixture was allowed to warm to room temperature and to stir overnight. Solvent was evaporated and 8 mL of hexane was added to give a suspension. HCl in dioxane (4.1 N, 1.5 mL, 6.0 mmol) was added at  $-78^\circ C$ . The mixture was slowly warmed to room temperature and stirred for 2 h. Additional hexane (6 mL) was added and crude product was isolated as a precipitate. This product was dissolved in chloroform and insoluble material was removed by filtration. The filtrate was evaporated at a reduced pressure to give an oil (~0.2 g). Final purification was achieved by chromatography on a column of Sephedex™ LH 20 column using methanol as a solvent. H-borophe(*m*-CN)- $C_{10}H_{16}$ ·HCl was obtained as an oil (0.12 g, 34% yield). HRMS( $NH_3$ -CI) m/e calcd. for M ( $C_{19}H_{26}BN_2O_2$ ) +  $H^+$ : 325.2087. Found: 325.2094.

## Example 124

Synthesis of Ac-(D)Phe-Pro-NH-CH[CH<sub>2</sub>-X]BO<sub>2</sub>-C<sub>10</sub>H<sub>16</sub> (X=4-amino-cyclohexyl).

Part A. The protected vinylic cyclohexanone (Scheme 12, 35) was prepared by first dissolving potassium t-butoxide (11 g, 0.10 moles) and methyltriphenyl phosphonium iodide (39 g, 0.10 moles) in 500 ml of anhydrous toluene, heating to reflux, and slowly adding cyclohexadione monoethylene ketal (15 g, 0.10 moles) as a toluene solution. The reaction mixture was refluxed for 3 hrs and then cooled to room temperature. It was poured over ice and the product was extracted into ether. The organic solution was washed with saturated aqueous NaCl (1 x 250 mL) and dried over anhydrous sodium sulfate. The organic solution was filtered and concentrated and applied to a silica gel column equilibrated with ethyl acetate: hexane (1: 5) to yield the desired product, 12 g, as a colorless oil.

Part B. The product of Part A (8.5 g, 55 mmols) was dissolved in 5 ml of anhydrous THF and added dropwise to 50 mmols of diisopinocampyl borane in 18 ml of THF. at 0°C. The diisopinocampyl borane was prepared prior to the reaction by a published procedure (Brown et al. J. Org. Chem 47, 5065, 1982). After stirring for 1 hr at 0°C, anhydrous acetaldehyde (8.8 g, 200 mmols) was added dropwise and the reaction stirred for 36 hr at room temperature. The solvent and alpha pinene were removed by evaporation and pinanediol (8.5 g, 50 mmols) dissolved in 40 ml of THF was added. Solvent was evaporated after 3 hrs to yield the desired crude product which was purified by chromatography on silica

gel using ethyl acetate: hexane (1: 5) to give the purified product in a yield of 96%.

Part C. The product of Part B (7.9 g, 24 mmols) and methylene chloride (3.6 g, 42 mmols), were dissolved in 5 200 ml of anhydrous THF and cooled to  $-78^{\circ}\text{C}$ . Lithium diisopropylamine (38 mmols), prepared by treating diisopropylamine (3.8 g, 38 mmols) with 25 mL of 1.5 M n-butyl lithium in hexane (38 mmols) in 20 ml of THF, was added dropwise. Anhydrous  $\text{ZnCl}_2$  (6.8 g, 50 mmols) 10 dissolved in 50 ml of THF was added and the reaction mixture was allowed to stir overnight at room temperature. Ether was added and the insoluble material removed. The organic phase was washed with water and dried over anhydrous  $\text{MgSO}_4$ . The crude product was 15 purified by silica gel chromatography using ethyl acetate: hexane to yield 8 g.

Part D. The product of Part C (1.3 g, 3.4 mmols) was dissolved in 25 ml of THF and cooled to  $-78^{\circ}\text{C}$ . This solution was added at  $-78^{\circ}\text{C}$  to a solution containing the 20 lithium salt of hexamethyldisilazane, which had been prepared by treating hexamethyldisilazane (2.9 g, 18 mmols) in 10 ml of THF with n-butyl lithium (1.5 N in hexane, 12 ml, 18 mmols), at  $-78^{\circ}\text{C}$  followed by warming to room temperature. After completion of addition, the 25 mixture was warmed to room temperature and stirred overnight. Solvent was evaporated and the residue dissolved in 100 ml of ether and 100 ml of pentane to yield a precipitate of  $\text{LiCl}$ . This solid material was filtered and the mother liquor concentrated. The 30 product, approximately 9.0 g (18 mmols), was dissolved in 40 ml of ether and was treated with 55 ml of anhydrous 1 N  $\text{HCl}$  in ether at  $-78^{\circ}\text{C}$ . The mixture was allowed to warm to room temperature and stirred overnight. Solvent was evaporated to yield the desired 35 product, 7.0 g, as a foam.

Part E. Ac-(D)Phe-Pro-OH (3.1 g, 10 mmol) in 50 ml of THF, N-methylmorpholine (1.1 ml, 10 mmol) and isobutylchloroformate (1.3 ml, 10 mmol) were mixed at -20°C. After 5 min, the product of Part D (4.0 g, 10 mmol) was added at -20°C as a 75 ml solution in THF. Triethylamine (1.4 ml, 10 mmol) was added and the mixture was stirred for 1 hr at -20°C and 3 hrs at room temperature. Solvent was evaporated and the residue was chromatographed on LH-20 using methanol as a solvent. Additional purification was achieved by chromatography on silica gel using a stepwise gradient from 1% methanol to 10% methanol in chloroform to yield 4.5 g of the desired product.

Part F. The product of Part E (0.10 g, 0.15 mmol) was converted to the ketone by dissolving it in 5 ml of dioxane and adding it to 5 ml of an aqueous suspension of BioRad AG50-X8 resin (H<sup>+</sup> form). The mixture was stirred overnight, filtered, and evaporated. The residue was chromatographed on silica gel using chloroform: methanol (9: 1) as a solvent to yield 75 mg of the desired product. Anal. 10 Synthesis of Boc-(D)Phe-Pro-NH-CH[CH<sub>2</sub>-X]BO<sub>2</sub>-C<sub>10</sub>H<sub>16</sub> (X=4-guanidino-cyclohexyl).

Part A. Boc-(D)Phe-Pro-NH-CH[CH<sub>2</sub>-(4-NH<sub>2</sub>-cyclohexyl)]BO<sub>2</sub>-C<sub>10</sub>H<sub>16</sub> (0.78 g, 1.1 mmol), N,N-dimethylaminopyridine (0.14 g, 1.1 mmol) and Z-N=C(S-Et)-NH-Z (0.43, 1.1 mmol) were suspended in 7 ml of isopropyl alcohol and heated to 50°C to give a complete solution. After 5 hrs., the solvent was evaporated and the residue dissolved in 50 ml of ethyl acetate and washed with 5%  $\text{NaCO}_3$  (50 mL), 0.20 N HCl (50 mL), and saturated aqueous NaCl (50 mL). The product was dried over anhydrous  $\text{Na}_2\text{SO}_4$ , filtered, and evaporated. The residue was purified by silica gel chromatography using 3% methanol in ethyl acetate as a solvent. The bis-carbobenzoxy protected guanidine was isolated as a white foam, 0.95 g. Anal. Calcd. for  $\text{M} (\text{C}_{54}\text{H}_{71}\text{N}_6\text{O}_{10}\text{B}) + \text{H}$ : 975.6. Found: 975.2.

Part B. The product of Part A (0.79 g, 0.81 mmol) was dissolved in 20 ml of methanol and hydrogenated in a Parr apparatus at an initial pressure of 50 psi in the presence of benzene sulfonic acid (0.13 g, 0.81 mmol) and 0.50 g of 10% Pd/C. After 4 hrs, the reaction mixture was filtered. The filtrate was concentrated and applied to a column of LH-20 in methanol. The desired product was obtained in a yield of 0.45 g. Anal. Calcd. for  $\text{M} (\text{C}_{38}\text{H}_{59}\text{N}_6\text{O}_6\text{B}) + \text{H}$ : 707.5. Found: 707.4.

## Example 129

Synthesis of Boc-(D)Phe-Pro-(R)Phe(mCN)-OMe

- 5 Part A. Z-NH-CH[P(OMe)<sub>2</sub>]COOMe (5.0 g, 15 mmoles) was dissolved in 50 ml of methanol and hydrogenated in a Parr apparatus (initial pressure 40 psi) in the presence of 0.40 g of 10%Pd/C. After one equivalent of hydrogen was consumed, the catalyst was removed by filtration and
- 10 the filtrate was evaporated to give the free amine.
- Part B. NH<sub>2</sub>-CH[P(OMe)<sub>2</sub>]COOMe (2.5 g, 13 mmoles), Boc-(D)Phe-Pro-OH (4.6 g, 13 mmoles), N-methylmorpholine (1.4 ml, 13 mmoles), and hydroxybenzotriazole·H<sub>2</sub>O (3.9 g, 25 mmoles) were dissolved in 150 ml of methylene
- 15 chloride and dicyclohexylcarbodiimide (2.6 g, 13 mmoles) was added. The mixture was allowed to stir overnight at room temperature. Insoluble material was removed by filtration, and the filtrate was evaporated. The residue was dissolved in ethyl acetate and washed with
- 20 5% NaHCO<sub>3</sub> (150 mL), 0.20 N HCl (150 mL), and saturated aqueous NaCl (150 mL). After drying over anhydrous MgSO<sub>4</sub> and evaporating, a white solid (5.7 g) was obtained. Anal. Calcd. for M (C<sub>24</sub>H<sub>36</sub>N<sub>3</sub>O<sub>9</sub>P) + H: 542.227. Found: 542.225.
- 25 Part C. Boc-(D)Phe-Pro-NH-CH[P(OMe)<sub>2</sub>]COOMe (1.4 g, 2.6 mmoles) was dissolved in 7 ml of THF and was added dropwise to a -78°C solution of lithium diisopropylamine (prepared by dissolving diisopropylamine (0.41 ml, 2.9 mmoles) in 5 ml of THF and adding 1.6 N n-butyl lithium
- 30 in hexane (1.7 ml, 2.6 mmoles at 0°C). During the addition, a precipitate formed which was dissolved by warming the reaction mixture to 0°C for 5 min and recooling to -78°C. m-Cyanobenzaldehyde (0.35 g, 2.6 mmoles) was dissolved in 3 ml of THF and added dropwise
- 35 to the reaction. The reaction was allowed to warm to room temperature and stir for approximately 3 hrs. The

solvent was evaporated, and the residue was dissolved in 50 ml of ethyl acetate and washed with saturated aqueous NaCl (50 mL) and was dried over anhydrous  $\text{MgSO}_4$ . After evaporation of solvent, the  $\alpha,\beta$ -unsaturated product 1.4

5 g, was obtained as a foam.

Part D. The product of Part C was hydrogenated in the presence of (R,R)DuPHOS catalyst according to the procedure of Burke et al. J. Am. Chem. Soc., 115, 10125, 1993. The desired product with the  $\alpha$ -carbon in the R configuration was obtained. Anal. Calcd. for M ( $\text{C}_{30}\text{H}_{36}\text{N}_4\text{O}_6$ ) + H: 549.271. Found: 549.271.

Boc-Pro-Phe(mCN)-OH (2.1 g, 5.4 mmoles) and N-  
20 methylmorpholine (1.3 ml, 12 mmoles) were dissolved in 35  
ml of methylene chloride and cooled to -5°C.  
Isobutylchloroformate (0.70 ml, 5.4 mmoles) was added,  
and the solution was stirred for 15 min at -5°C. N-  
Methyl-N-methoxyamine (0.87 g, 9.0 mmoles) was added and  
25 the mixture was stirred 45 min at -5°C and 3 hrs at room  
temperature. Water (35 mL) was added and the phases  
were separated. The aqueous phase was washed with  
methylene chloride (1x 50 mL) and the combined organic  
phases were dried over MgSO<sub>4</sub> and evaporated. The  
30 product was purified by chromatography using ethyl  
acetate: hexane (2: 1). The product was recrystallized  
from ethyl acetate: hexane to yield 2.0 g (mp 130-

### Utility

15 N-Acyl and N-peptide boronic acids and amino acids which are described in the present invention represent a novel class of potent inhibitors of trypsin-like enzymes. Trypsin-like enzymes are a group of proteases which hydrolyzed peptide bonds at basic residues  
20 liberating either a C-terminal arginyl or lysyl residue. Among these are enzymes of the blood coagulation and fibrinolytic system required for hemostasis. They are

Factors II, X, VII, IX, XII, kallikrein, tissue plasminogen activators, urokinase-like plasminogen activator, and plasmin. Enzymes of the complement system, acrosin (required for fertilization), pancreatic trypsin are also in this group. Elevated levels of proteolysis by these proteases can result in disease states. For example, consumptive coagulopathy, a condition marked by a decrease in the blood levels of enzymes of both the coagulation system, the fibrinolytic system and accompanying protease inhibitors is often fatal. Intervention by a synthetic inhibitor would clearly be valuable. More specifically, proteolysis by thrombin is required for blood clotting. Inhibition of thrombin results in an effective inhibitor of blood clotting. The importance of an effective inhibitor of thrombin is underscored by the observation that conventional anticoagulants such as heparin (and its complex with the protein inhibitor, antithrombin III) are ineffective in blocking arterial thrombosis associated with myocardial infarctions and other clotting disorders. However, a low molecular weight thrombin inhibitor, containing a different functionality, was effective in blocking arterial thrombosis [Hanson and Harker (1988) *Proc. Natl. Acad. Sci. U.S.A.* 85, 3184-3188]. Therefore, we have chosen to demonstrate utility of compounds in the inhibition of thrombin, both as in buffered solutions and in plasma. Specifically, the compounds have utility as drugs for the treatment of diseases arising from elevated thrombin activity such as myocardial infarction, and as reagents used as anticoagulants in the processing of blood to plasma for diagnostic and other commercial purposes.

Compounds of the present invention are expected to be effective in the control of aberrant proteolysis and a number of accompanying disease states such as inflammation, pancreatitis, and hereditary angioedema.

The effectiveness of compounds of the present invention as inhibitors of blood coagulation proteases was determined using purified human proteases and synthetic substrates following procedures similar to those described in Kettner et al. (1990).

For these assays, the rate of enzymatic (thrombin, Factor Xa, and Factor VIIa) hydrolysis of chromogenic substrates (S2238 (H-D-Phe-Pip-Arg-pNA), S2222, and S2288, respectively; Kabi Pharmacia, Franklin, OH) was measured both in the absence and presence of compounds of the present invention. Hydrolysis of the substrate resulted in the release of pNA, which was monitored spectrophotometrically by measuring the increase in absorbance at 405 nm. A decrease in the rate of absorbance change at 405 nm in the presence of inhibitor is indicative of enzyme inhibition. The results of this assay are expressed as inhibitory constant,  $K_i$ .

Thrombin and Xa determinations were made in 0.10 M sodium phosphate buffer, pH 7.5, containing 0.20 M NaCl, and 0.5 % PEG 8000. VIIa determinations were made in 0.05 M tris buffer, pH 7.6, containing 0.10 M NaCl, 4 mM  $\text{CaCl}_2$ , and 0.1% bovine serum albumin. The Michaelis constant,  $K_m$ , for substrate hydrolysis was determined at 25 °C using the method of Lineweaver and Burk.

Values of  $K_i$  were determined by allowing 0.2 - 0.5 nM human thrombin or human factor Xa (Enzyme Research Laboratories, South Bend, IN) , or 50 nM human factor VIIa (BiosPacific, Emeryville, CA) react with the substrate (0.20 mM - 1 mM) in the presence of inhibitor. Reactions were allowed to go for 30 minutes and the velocities (rate of absorbance change vs time) were measured in the time frame of 25-30 minutes. The following relationship was used to calculate  $K_i$  values.

$$\frac{v_0 - v_s}{v_s} = \frac{I}{K_i (1 + S/K_m)}$$

where:

$v_0$  is the velocity of the control in the absence of inhibitor;

5  $v_s$  is the velocity in the presence of inhibitor;

$I$  is the concentration of inhibitor;

$K_i$  is the dissociation constant of the enzyme: inhibitor complex;

$S$  is the concentration of substrate;

10  $K_m$  is the Michaelis constant.

Using the methodology described above, representative compounds of this invention were evaluated and found to exhibit a  $K_i$  of less 500  $\mu\text{M}$  thereby confirming the utility of compounds of the invention as effective inhibitors of human blood coagulation proteases. The results of these assays are summarized in Table 3, where +++ indicates a  $K_i < 500 \text{ nM}$ ; ++ indicates a  $K_i < 50,000 \text{ nM}$ ; + indicates a  $K_i 500,000 < \text{nM}$ ; - indicates inactive; and NT indicates Not Tested.

Representative of data for compounds of the present invention, Examples 3, 7, 9, 11, and 12 increased thrombin clotting times 2-fold at 0.25, <0.075, 0.10, 0.60, and 0.85  $\mu\text{M}$ , respectively.

The effectiveness of compounds of the present invention as anticoagulants in vivo was demonstrated by the prolongation of the activated partial thromboplastin time of samples of blood taken from conscious dogs or anesthetized rats after either oral or intravenous administration at doses of the compounds from 0.5 to 10 mg/kg. Arterial or venous blood was withdrawn by syringe and mixed with 1/10 volume 3.2% sodium citrate. Plasma was obtained after centrifugation and a standard clinical activated partial thromboplastin time (APTT

reagent, Sigma Chemical Co., St. Louis, Mo.) determined at 37°C in a fibrometer. Results from blood samples obtained at various times after dosing showed an effective-anticoagulant response which was at least equivalent to doubling of activated partial thromboplastin time as compared to the value obtained prior to dosing. In this model, Examples 4, 57, and 77 were shown to be effective following i.v. dosing and Examples 4, 56, 57, 60, and 66 effective following oral dosing. Similarly, oral administration of Examples 31 and 54 resulted in at least a 2-fold elevation in anticoagulant activity in an identical model except activity was measured by increases in thrombin clotting times.

What is Claimed is:

1. A compound of formula (I)

5

I

wherein

E is

- 10 a)  $-\text{BY}^1\text{Y}^2$ ,  
 b)  $-\text{C}(=\text{O})\text{R}^{14}$ ;  
 c)  $-\text{C}(=\text{O})\text{OR}^4$ ,  
 d)  $-\text{C}(=\text{O})\text{NR}^{15}\text{R}^{16}$ ,  
 e)  $-\text{C}(=\text{O})\text{R}^4$ , or  
 f)  $-\text{C}(=\text{O})\text{COOR}^4$ ;

15

$\text{Y}^1$  and  $\text{Y}^2$  are

- a)  $-\text{OH}$ ,  
 b)  $-\text{F}$ ,  
 c)  $-\text{NR}^4\text{R}^5$ ,  
 20 d)  $\text{C}_1\text{-C}_8$  alkoxy, or

when taken together  $\text{Y}^1$  and  $\text{Y}^2$  form:

- 25 e) a cyclic boron ester where said chain or ring contains from 2 to 20 carbon atoms and, optionally, 1-3 heteroatoms which can be N, S, or O,  
 f) a cyclic boron amide where said chain or ring contains from 2 to 20 carbon atoms and, optionally, 1-3 heteroatoms which can be N, S, or O,  
 30 g) a cyclic boron amide-ester where said chain or ring contains from 2 to 20 carbon atoms and,

optionally, 1-3 heteroatoms which can be N, S,  
or O;

$y^3$  and  $y^4$  are

- 5           a) -OH,  
            b) -H, or  
            c) -F;

$R^1$  is

- 10           a) C1-C12-alkyl is optionally substituted with -CN,

## INTERNATIONAL SEARCH REPORT

International application no.

PCT/US95/13702

## A. CLASSIFICATION OF SUBJECT MATTER

IPC(6) :A61K 38/06

US CL :514/18

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 514/18, 17, 16; 530/331.330

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

APS, CAS ONLINE

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim N°
A, P	US, A, 5,371,072 (WEBB ET AL) 06 December 1994, see entire document.	1-24
A	Bioorganic & Medicinal Chemistry Letters, Volume 2, No. 12, issued 1992, Iwanowicz et al, " $\alpha$ -Hydroxy- and $\alpha$ -Ketoester Functionalized Thrombin Inhibitors", pages 1607-1612, see entire document.	1-24

☐ Further documents are listed in the continuation of Box C.☐ See patent family annex.

## Special categories of cited documents:

\*A\* document defining the general state of the art which is not considered to be of particular relevance

\*E\* earlier document published on or after the international filing date

\*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

\*O\* document referring to an oral disclosure, use, exhibition or other means

\*P\* document published prior to the international filing date but later than the priority date claimed

\*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

\*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

\*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

\*Z\* document member of the same patent family
